SUMMARY

Junior Site Reliability Engineer at IAMOPS, handling monitoring, incident response, and root cause analysis for production cloud services across 7 clients. Built Housefull, a containerized booking platform on Google Cloud, with Terraform and GitHub Actions.

PROFESSIONAL EXPERIENCE

Jr. SRE, IAMOPS *Jul 2026 to Present, Surat, Gujarat*

- Diagnosed a sudden traffic drop by checking metrics along the request path and ruling out the database and application tasks. Found steadily rising memory on an internal ECS service, which led developers to a memory leak.
- Triage around 20 alerts per shift, and up to 96 during a deployment, across 7 clients using Grafana and New Relic, escalating by severity and runbook.
- Coordinate with on-call engineers during incidents, keeping teams updated and giving clear handoffs.
- Write root cause analyses that identify recurring failures and the steps to prevent them.
- Report incident and MTTR trends for reliability reviews.

Technical Intern, IAMOPS *Jan 2026 to Jun 2026, Surat, Gujarat*

- Deployed a 3-tier application on AWS, with application servers in private subnets behind a public Application Load Balancer.
- Ran containerized services on Amazon ECS and EC2, with S3 and EFS for storage and Route 53 for DNS.
- Set up a custom VPC with subnets, route tables, a NAT Gateway, and security groups to control access between services.
- Deployed across multiple Availability Zones for high availability, and monitored costs with AWS Cost Explorer.

PROJECTS

Housefull: Ticket Booking Platform on GCP *housefull.jeneeldumasia.dev | github.com/jeneeldumasia/housefull*

- Built a Python booking API and a separate Pub/Sub worker on PostgreSQL, using row locks so concurrent requests can never double-book a seat.
- Wrote reusable Terraform modules for a custom VPC, private Cloud SQL, Pub/Sub, Cloud Run, and a load balancer, with remote state in HCP Terraform.
- Built GitHub Actions pipelines for tests, Terraform plans, image scanning, and gradual releases through a 10% traffic stage, using Workload Identity Federation so no cloud keys are stored.
- Load tested the live site to 100 requests per second with no failures and a 181 ms p95. Past the limit, connection budgets kept the database healthy and 1,732 bookings stayed free of double-booking.
- Added Trivy image scanning to the pipeline, which blocked a release on a critical dependency vulnerability until it was fixed.

SKILLS

Cloud: AWS (EC2, ECS, S3, EFS, VPC, Route 53), GCP (Cloud Run, Cloud SQL, Pub/Sub, VPC)
Containers: Docker, Docker Compose, Kubernetes (basic)
Infrastructure & CI/CD: Terraform, GitHub Actions, Git
Monitoring: Grafana, Prometheus, Loki, New Relic
Scripting & Databases: Python, Bash, SQL, PostgreSQL
Linux & Networking: Linux, DNS, TCP/IP, Load Balancing

EDUCATION

Bachelor of Technology in Computer Science and Engineering *Jul 2026, Surat, India*
P. P. Savani University

TRAINING

- AWS Knowledge: Cloud Essentials, Amazon Web Services, Feb 2026 (verify)
- AWS Academy Graduate: Cloud Foundations, Amazon Web Services, Mar 2025 (verify)
- Python for Everybody Specialization, University of Michigan, Sep 2023 (verify)
- The Bits and Bytes of Computer Networking, Google
